

**usev** This helper has an optional second argument now: `usev <flag> [true]`. If the flag is set, outputs `[true]`, or the flag's name if called with only one argument. Otherwise outputs nothing. See USEV on page 74.

### Removals/bans

**useq** No longer allowed. Use regular `use` as a drop-in replacement. See BANNED-COMMANDS on page 62.

**hasv and hasq** No longer allowed. Regular `has` should be used instead. See BANNED-COMMANDS on page 62.

**unpack** No longer supports unpacking of 7-Zip, RAR, and LHA archives. See UNPACK-EXTENSIONS on page 76.

## EAPI 9

### Additions/changes

**Default EAPI for profiles** Profile directories without their own `eapi` file no longer default to EAPI 0, but to the EAPI specified in the top-level `profiles` directory. See PROFILE-EAPI-DEFAULT on page 23.

**use.stable and package.use.stable** Profile dirs may contain two new files. They can be used to override the USE flags specified by `make.defaults`, but act only on packages that would be merged due to a stable keyword. See USE-STABLE on page 25.

**Bash version** Ebuilds can use features of Bash version 5.2 (was 5.0 before). See BASH-VERSION on page 30.

**Variables are no longer exported** The package manager no longer exports its defined shell variables (exceptions are `TMPDIR` and `HOME`) to the environment. The same applies to variables defined in `make.defaults` that have specific meanings. See EXPORT-VARS on page 52.

**pipestatus** Checks if all commands in the last executed pipeline have returned an exit status of zero. When the `-v` option is specified, also prints the shell's pipe status array. See PIPESTATUS on page 64.

**ver\_replacing op v2** Checks if the relation `v1 op v2` is true for any element `v1` of REPLACING VERSIONS. `op` can be any operator that is accepted by `ver_test`. See VER-REPLACING on page 76.

**edo** Outputs its entire argument list as an informational message, then executes it as a simple shell command, with standard failure behaviour. See EDO on page 78.

**Merging of symlinks** When merging D to ROOT, absolute symlinks are now merged as-is. The package manager will no longer strip a leading D from their link targets. See SYMLINK-REWRITE on page 82.

### Removals/bans

**assert** No longer allowed. Use `pipestatus` instead. See BANNED-COMMANDS on page 62.

**domo** No longer allowed. Use `insinto` and `newins` as replacement. See BANNED-COMMANDS on page 62.

# EAPI Cheat Sheet

Christian Faulhammer  
fauli@gentoo.org

Ulrich Müller  
ulm@gentoo.org

Version 9.0  
21st June 2025

### Abstract

An overview of the main EAPI changes in Gentoo, for ebuild authors. For full details, consult the Package Manager Specification found on the project page;<sup>1</sup> this is an incomplete summary only.

Official Gentoo EAPIs are consecutively numbered integers (0, 1, 2, ...). Except where otherwise noted, an EAPI is the same as the previous EAPI. All labels refer to the Package Manager Specification itself, built from the same checkout as this document.

This work is released under the Creative Commons Attribution-ShareAlike 4.0 International licence.<sup>2</sup>

## EAPIs 0 to 6

Omitted for lack of space. See previous versions of this document for differences between these EAPIs.

## EAPI 7 (2018-04-30)

### Additions/changes

**package.\* and use.\*** These profile files can be directories instead of regular files. This is intended to be used in overlays only. See PACKAGE-MASK-DIR on page 19 and PROFILE-FILE-DIRS on page 24.

**Additions/changes**

**proftiles/updaters directory** Arbitrary filenames are now allowed, instead of strict naming by quarters (like 2Q-2021). See UPDATES-FILENAMES on page 50.

**Bash version** Builds can use features of Bash version 5.0 (was 4.2 before). See BASH-VERSION on page 30.

**selective fetch/mirror restriction** In SRC-URI, adding a `fetch+or mix+prefix` to an individual URI means that the file may be fetched or mirrored. This overrides the corresponding global settings in the RESTRICT variable. See URI-RESTRICT on page 33.

**IDEPEND** This variable specifies install-time dependencies for native tools (CBUILD). See IDEPEND on page 36. These are dependencies between environments, like cross-compilation environments (e.g.) `pkg_positools`. In a class on packages used in (e.g.) `pkg_positools` for native tools (CBUILD). See IDEPEND on page 36.

**pkg\_\* phases** The initial working directory is guaranteed to be empty. See PHASE-FUNCTION-DIR on page 42. `src_prepare` items in the PATCHES variable are interpreted as files, even if their name begins with a hyphen. See SRC-PREPARE on page 44.

**PROPERTIES and RESTRICT** These variables are accumulated across the build and inherited classes, like USE, REQUIRED-USC, and \*DEPEND were before. `ecore` If supported, options `-idisable-static` and `--datarootdir=$(PREFIX)/usr/share` are passed to configure, respectively. See ECONF-OPTIONS on page 66.

**ecore** If supported, options `-idisable-static` and `--datarootdir=$(PREFIX)/usr/share` are passed to configure, respectively. See ECONF-OPTIONS on page 66.

**insopts** Commands documented, detailed, documented, affected by `insopts`. See INSOPTS on page 72. **dosym** With the new option `-x`, an absolute path specified for the link target will be converted to a path relative to the link location. See DOSYM-RELATIVE on page 70.

**excepts** Command documented, installed files with fixed mode 0755, i.e. it is no longer affected by `excepts`. See EXPORTS on page 72.

**dotlib and libopts** No longer allowed. The specific replacement. See BANNED-COMMANDS on page 62.

**dothtml** No longer allowed. dots -x can be used as a replacement. See BANNED-COMMANDS on page 62.

**DESTREE and INSDESTREE** Not defined any more. DESTREE on page 55 and INSDESTREE instead. See DESTREE and INSDESTREE on page 54.

**PORTDIR and ECASSDIR** No longer defined, because builds should not directly access files in the repository. Finally dropped. See PACKAGE-PROVIDED on page 25.

**Packages PROVIDED** Deprecated since a long time and finally dropped. See PACKAGE-PROVIDED on page 25.

**Removals/bans**

**See VER-COMMANDS on page 75.**

**-ge, -lt or -le.**

**ver-test [vt] op v2** Check if the relation `vt op v2` is true. `vt` defaults to PV; `op` can be `-eq`, `-ne`, `-gt`,

**ver\_is\_range repl ... [version]** Replace all version `rep` pairs are allowed. `version` defaults to PV.

**ver-cut range [version]** Print the version substring specified by range. `version` defaults to PV.

**ver-manipulation and comparison commands** The command can be used to add paths to an exclusion list for stripping of symbols, to allow more fine-grained control than debug symbols.

**controllable stripping** The `dstrip -x` command can be used to add paths to an exclusion list for stripping of symbols, to allow more fine-grained control than debug symbols, to allow more fine-grained control than stripping by range. `version` defaults to PV.

**domo destination** domo installs the specified files under share/Locale. See DOMO-PATH on page 70.

**dir in subshell** The `dir` command is guaranteed to work in a subshell context. See SUBHELL-DIE on page 64.

**egawarn** The egawarn output command is supported in a package manager itself. See EGAWARN on page 64.

**Output commands** `info` and friends no longer use std-out, so inside of command substitution their output won't be caught. See OUTPUT-NO-STDOUT on page 63.

**nonfatal** In addition to its definition as a shell function, the nonfatal wrapper has now a fallback implementation from other commands. See NONFATAL on page 62.

**patch** All inputs valid for GNU patch version 2.7 are supported. Especially, this includes support for git-formatted patches. See GNU-PATCH on page 61.

**ENV-UNSET** Any environment variable listed in the profile-defined ENV-UNSET variable will be unset by the package manager. See ENV-UNSET on page 57.

**Environment blacklist** Any environment variable listed in `has_version and best_version` These helpers support `-b`, `-d` or `-x` options, causing the query to apply to BDEPEND, DEPEND or RDEPEND (the default). This replaces the `-host-root` option.

**PM-QUIET-OPTIONS** See PM-QUIET-OPTIONS on page 63.

**ECONF-OPTIONS** See ECONF-OPTIONS on page 66.

**SYSSROOT** Configuration will be called with the concatenated `SYSSROOT` and the offset-prefix. See SYSSROOT on page 54.

**BSROOT** The prefixed root directory path for BDEPEND type dependencies, typically executable build tools. See BSROOT on page 54.

**EVSYSROOT** The concatenation of `SYSSROOT` and the type dependencies. See SYSSROOT on page 54.

**SYSROOT** The path to the root directory for DEPEND item being built (`CHOST`). See BDEPEND on page 36.

**DEPEND** Build dependencies are divided into two classes: BDEPEND for native build tools (CBUILD); DEPEND for dependencies compatible with the sys-

**BDEPEND** Build dependencies have been extended for better cross compilation support:

**Cross compilation support** Several variables have been added and some commands have been extended for ROOT is empty now. See TRAILING-SLASH on page 59.

**No trailing slash** The paths specified by ROOT, EROOT, See EMPTY-DEP-GROUPS on page 38.

**are only unmatched use dependencies inside of them).** are set to false when they are empty (for example, if there are only unmatched use dependencies inside of them).

**|| and & dependency groups** These groups now eval-
