

Cross compilation support Several variables have been added and some commands have been extended for better cross compilation support:

BDEPEND Build dependencies are divided into two classes: `BDEPEND` for native build tools (`CBUILD`); `DEPEND` for dependencies compatible with the system being built (`CHOST`). See `BDEPEND` on page 34.

SYSROOT The path to the root directory for `DEPEND` type dependencies. See `SYSROOT` on page 52.

ESYSROOT The concatenation of the `SYSROOT` and `EPREFIX` paths, for convenience.

BROOT The prefixed root directory path for `BDEPEND` type dependencies, typically executable build tools. See `BROOT` on page 52.

econf If supported, configure will be called with the `--with-sysroot=${ESYSROOT:-/}` option. See `ECONF-OPTIONS` on page 64.

has_version and best_version These helpers support `-b`, `-d` or `-r` options, causing the query to apply to `BDEPEND`, `DEPEND` or `RDEPEND` (the default). This replaces the `--host-root` option. See `PM-QUERY-OPTIONS` on page 61.

Environment blacklist Any environment variable listed in the profile-defined `ENV_UNSET` variable will be unset by the package manager. See `ENV_UNSET` on page 55.

patch All inputs valid for GNU patch version 2.7 are supported. Especially, this includes support for git-formatted patches. See `GNU-PATCH` on page 59.

nonfatal In addition to its definition as a shell function, the `nonfatal` wrapper has now a fallback implementation as an external command. Thus, it can be called from other commands. See `NONFATAL` on page 60.

Output commands `einfo` and friends no longer use `stdout`, so inside of command substitution their output won't be caught. See `OUTPUT-NO-STDOUT` on page 61.

eqawarn The `eqawarn` output command is supported in the package manager itself. See `EQAWARN` on page 61.

die in subshell The `die` command is guaranteed to work in a subshell context. See `SUBSHELL-DIE` on page 62.

domo destination `domo` installs the specified files under `/usr/share/locale` instead of `${DESTTREE}/share/locale`. See `DOMO-PATH` on page 67.

Controllable stripping The `dostrip -x` command can be used to add paths to an exclusion list for stripping of debug symbols, to allow more fine-grained control than with `RESTRICT="strip"`. See `DOSTRIP` on page 70.

Version manipulation and comparison commands

ver_cut range [version] Print the version substring specified by *range*. *version* defaults to `PV`.

ver_rs range repl ... [version] Replace all version separators in *range* by string *repl*. Multiple *range repl* pairs are allowed. *version* defaults to `PV`.

ver_test [v1] op v2 Check if the relation *v1 op v2* is true. *v1* defaults to `PVR`; *op* can be `-eq`, `-ne`, `-gt`, `-ge`, `-lt` or `-le`.

See `VER-COMMANDS` on page 72.

Removals/Bans

package.provided Deprecated since a long time and finally dropped. See `PACKAGE-PROVIDED` on page 24.

PORTDIR and ECLASSDIR No longer defined, because `ebuilds` should not directly access files in the repository. See `PORTDIR` on page 52 and `ECLASSDIR` on page 52.

DESTTREE and INSDESTTREE Not defined any more. Use the `into` and `insinto` commands instead. See `DESTTREE` on page 53 and `INSDESTTREE` on page 53.

dohtml No longer allowed. `doins -r` can be used as a replacement. See `BANNED-COMMANDS` on page 60.

dolib and libopts No longer allowed. The specific `dolib.a` or `dolib.so` commands should be used as replacement. See `BANNED-COMMANDS` on page 60.

EAPI Cheat Sheet

Christian Faulhammer
fauli@gentoo.org

Ulrich Müller
ulm@gentoo.org

Version 7.0
6th November 2019

Abstract

An overview of the main EAPI changes in Gentoo, for `ebuild` authors. For full details, consult the Package Manager Specification found on the project page;¹ this is an incomplete summary only.

Official Gentoo EAPIs are consecutively numbered integers (0, 1, 2, ...). Except where otherwise noted, an EAPI is the same as the previous EAPI. All labels refer to the PMS document itself, built from the same checkout as this overview.

This work is released under the Creative Commons Attribution-Share Alike 3.0 Licence.²

EAPIs 0, 1, 2, 3, and 4

Omitted for lack of space. See version 5.0 of this document for differences between these previous EAPIs.

EAPI 5 (2012-09-20)

Additions/Changes

Sub-slots The `SLOT` variable and slot dependencies may contain an optional sub-slot part that follows the regular slot, delimited by a `/` character; for example `2/2.30`. The sub-slot is used to represent cases in which an upgrade to a new version of a package with a different sub-slot may require dependent packages to be rebuilt. If the

¹https://wiki.gentoo.org/wiki/Project:Package_Manager_Specification

²<https://creativecommons.org/licenses/by-sa/3.0/>

sub-slot is not specified in `SLOT`, it defaults to the regular slot. See `SUB-SLOT` on page 38.

Slot operator dependencies Package dependencies can specify one of the following operators as a suffix, which will affect updates of runtime dependencies:

***** Any slot value is acceptable. The package will not break when its dependency is updated.

::= Any slot value is acceptable, but the package can break when its dependency is updated to a different slot (or sub-slot).

See `SLOT-OPERATOR-DEFS` on page 38.

Profile IUSE injection Apart from the `IUSE` flags explicitly listed in `IUSE`, additional flags can be implicitly provided by profiles. See `PROFILE-IUSE-INJECT` on page 56.

At-most-one-of groups In `REQUIRED_IUSE` you can use `"? (flag1 flag2 ...)"` to allow zero or one `IUSE` flag out of many. See `AT-MOST-ONE-OF` on page 35.

Parallel tests The default for `src_test` runs `emake` without `-j1` now. See `PARALLEL-TESTS` on page 43.

has_version and best_version changes The two helpers support a `--host-root` option that causes the query to apply to the host root instead of `ROOT`. See `PM-QUERY-OPTIONS` on page 61.

usex Usage for this helper function is `usex <USE flag> [true1] [false1] [true2] [false2]`. If the `USE` flag is set, outputs `[true1] [false1] [true2] [false2]` (defaults to `yes`), otherwise outputs `[false1] [false2]` (defaults to `no`). See `USEX` on page 71.

dohheader and newheader These new helper functions install the given header file(s) into `/usr/include`. The `-r` option enables recursion for `dohheader`, similar to `doins`. See `DOHEADER` on page 66.

new* standard input The `newins` etc. commands read from standard input if the first argument is `-` (a hyphen). See `NEWFOO-STDI` on page 68.

EBUILD_PHASE_FUNC This variable is very similar to `EBUILD_PHASE`, but contains the name of the current `ebuild` function. See `EBUILD-PHASE-FUNC` on page 54.

Stable use masking/forcing New files `use.stable`, `{mask,force}` and `package.use.stable`, `{mask,force}` are supported in profile directories. They are similar to their non-stable counterparts, but act only on packages that would be merged due to a stable keyword. See `STABLEMASK` on page 24.

EAPI 6 (2015-11-13)

Additions/Changes

Bash version Ebuilds can use features of Bash version 4.2 (was 3.2 before). See `BASH-VERSION` on page 28.

failglob The `failglob` option of Bash is set in global scope, so that unintentional pattern expansion will be caught as an error. See `FAILGLOB` on page 28.

Locale settings It is ensured that the behaviour of case modification and collation order for ASCII characters (`LC_TYPE` and `LC_COLLATE`) are the same as in the POSIX locale. See `LOCAL-SETTINGS` on page 55.

src_prepare This phase function has a default now, which applies patches from the `PATCHES` variable with the new `apply` command, and user-provided patches with `apply_user`. See `SRC-PREPARE-6` on page 41.

src_install The default implementation uses the new `installdocs` function for installing documentation. See `SRC-INSTALL-6` on page 44.

nonfatal die When `die` or `assert` are called under the `nonfatal` command and with the `-n` option, they will not abort the build process but return with an error. See `NONFATAL-DIE` on page 62.

unpack changes `unpack` has been extended:

Pathnames Both absolute paths and paths relative to the working directory are accepted as arguments. See `UNPACK-ABSOLUTE` on page 73.

.txz files Suffix `.txz` for `xz` compressed tarballs is recognised. See `UNPACK-EXTENSIONS` on page 73.

Filename case Character case of filename extensions is ignored. See `UNPACK-IGNORE-CASE` on page 74.

econfc changes Options `--docdir` and `--htmldir` are passed to `configure`, in addition to the existing options. See `ECONF-OPTIONS` on page 64.

apply The `apply` command is a simplified substitute for `patch`, implemented in the package manager. The patches from its file or directory arguments are applied using `patch -p1`. See `APPLY` on page 62.

apply_user The `apply_user` command permits the package manager to apply user-provided patches. It must be called from every `src_prepare` function. See `APPLY-USER` on page 62.

installdocs The `installdocs` function will install the files specified by the `DOCS` variable (or a default set of files if `DOCS` is unset) and by the `HTML_DOCS` variable. See `EINSTALLDOCS` on page 74.

in_use The `in_use` function returns true if the `USE` flag given as its argument is available in the `ebuild` for `USE` queries. See `IN-USE` on page 71.

get_libdir The `get_libdir` command outputs the `lib*` directory basename suitable for the current ABI. See `GET-LIBDIR` on page 74.

Removals/Bans

install No longer allowed. Use `emake install` as replacement. See `BANNED-COMMANDS` on page 60.

EAPI 7 (2018-04-30)

Additions/Changes

package.* and use.* These profile files can be directories instead of regular files. This is intended to be used in overlays only. See `PACKAGE-MASK-DIR` on page 19 and `PROFILE-FILE-DIRS` on page 23.

! and ^ dependency groups These groups now evaluate to false when they are empty (for example, if there are only unmatched use dependencies inside of them). See `EMPTY-DEP-GROUPS` on page 36.

No trailing slash The paths specified by `ROOT`, `ERROR`, `D`, and `ED` no longer end with a slash. Thus, default `ROOT` is empty now. See `TRAILING-SLASH` on page 57.
